Child/Adolescent Periodontal Disease

Diagnosing periodontal disease in its early stages is a very difficult task as early signs of bone loss may be difficult to visualize on conventional xrays.

We are currently evaluating the feasibility of a possible new study to test the reliability of current methods to diagnose periodontal disease in children/adolescents.

The results of this [5-question poll](#) will help determine whether this issue warrants further investigation.

We appreciate your valuable time and help with your responses to our poll!
